

Limestone Rim Complex (9)

Location: This complex of woodland, shrubland, and sparse plant associations occurs on south, east, and west-facing canyon slopes in Walnut Canyon. It also occurs on north-facing slopes in the lower part of Walnut Canyon where the canyon is wider and the walls are less steep.

Photosignature: The basic color of the signature is white, modified by the type of vegetation present. Sparse vegetation tints the signature slightly gray to light green with a mottled texture. Denser shrublands and areas where pinyon pines and junipers grow are more speckled in appearance; the speckles are gray and brownish green.
